A Global Bioethical Perspective on Human Health and Sustainability

The 21st century environmental concerns including outdoor air quality and water quality, loss of biodiversity, and climate change are potentially influencing human health. Human health complications such as heart disease, birth defects, nervous system damage, and certain internal imbalances may be influenced by environmental damage. A global bioethical perspective may help leadership advance sustainability by understanding key decision-making processes with an environmental culture lens. A global bioethical perspective may bring awareness to unintended environmental health consequences to aid in mitigating environmental adversities as well as maximizing sustainable solutions by exploring the moral and ethical foundations of new policies and technology before implementation.
